Compliments of Dr. Harvey Schwartz & Dr. Shirley Ho

News From the Office of:

Dr. Shirley Ho
Dr. Harvey E. Schwartz

Welcome to our latest newsletter. This issue focuses on early dental warning signs to be aware of, and things you can do at home to ensure the best oral health for you and your family.

Speaking of family, I'd like to take a moment to thank all of you who have recommended our dental services to other family members, and to your friends and neighbors too. We truly appreciate your referrals, and view your recommendations as the greatest compliment to the quality of our services!

Enjoy this issue of our newsletter, and if you or someone you know needs more information, please do not hesitate to call with your questions. We look forward to seeing you soon.

All the best,

Shirley Ho

A PERFECTLY HEALTHY SMILE!

While achieving a healthy smile is our number one priority for our patients, we recognize that the emphasis on having a "perfect"-looking smile is also a highly desired goal for many men and women today.

According to some, the perfect masculine smile has square teeth, with the edges of the teeth following a straight line, while a feminine smile involves more rounded teeth, with the edges of the top teeth following the lower lip line, creating more curvature.

Overall, the standard for straight teeth is that they should be equally spaced and symmetrical, and they should line up with the teeth on the opposite jaw. Proper tooth positioning includes teeth that are vertical, with no protrusions or angles. A lot of emphasis is put on the front teeth from the perspective of general appearance, but it's important not to forget about the back teeth, the molars, as they must be healthy and positioned correctly in order to bear the work of chewing and grinding food, to relieve wear and tear on the front teeth.

Teeth whitening is a popular cosmetic enhancement. While it's true that whiter teeth can project

an attractive, younger image, it's important to make sure that your gums and teeth are healthy before starting any whitening process. If you have sensitive teeth and gums, receding gums or perhaps some restorations in your mouth, it's especially important to have your mouth checked before agreeing to any type of teeth whitening.

Healthy gums and teeth are a prerequisite to any kind of cosmetic smile enhancement. However, sometimes improved oral health can be linked to something that is considered a cosmetic enhancement. For example, you may want to straighten your teeth for a more attractive smile, but on a more practical level, it's harder to clean cavity-causing plaque from between crowded or crooked teeth. A malocclusion can even cause headaches, so you'll want to look into options to fix your teeth for both an attractive smile and improved general health.

PLEASE ASK US TO EXPLAIN ALL THE OPTIONS AVAILABLE, TO CREATE YOUR OWN "PERFECT" SMILE!

GEN

RED ALERT!

If your gums bleed when you brush, or if you notice traces of blood on your toothbrush or in the sink after you rinse your mouth, it may be a warning sign of gum disease.

Scrubbing your teeth vigorously with a hard toothbrush can also lead to bleeding gums, but in most instances any “pink in the sink” can be traced directly back to some degree of gum disease, or at least some accumulation of dental plaque where the teeth meet the gums.

Plaque is a sticky film of bacteria that, if not removed on a daily basis, builds up at the gum line. Any accumulation serves to inflame the gum tissues, which initiates the first step toward gum disease: gingivitis. Gums then become red and irritated, and may bleed when you brush or floss.

It is vitally important to remove dental plaque from your teeth and under the gums. While vigilant dental home care is key, regular, professional cleanings and scaling at your dental office are also vital, to remove the plaque from areas you may not be able to reach, and control any chance of plaque accumulation and subsequent gum inflammation.

Gum disease (“periodontitis” or “periodontal disease”) is a common bacterial infection of the tissues surrounding the teeth. If this infection isn’t taken care of, the gums and bone that support the teeth deteriorate, leading to tooth loss. Periodontitis is usually painless in its early stages, and therefore a “silent” disease. Once it starts progressing however, you may notice some of these indicators of possible gum disease:

- Gums that bleed when you brush your teeth or eat hard foods.
- Red, swollen or tender gums.
- Gums that have pulled away from the teeth, or teeth that look longer than before.
- Pus between your teeth and gums.
- New spaces between your teeth.
- Persistent bad breath or bad taste in your mouth.
- A change in the way your teeth or partial dentures fit together when you bite.

Even if the above indicators aren’t obvious, be aware that plaque can be working against your dental health in ways you may not notice on a day-to-day basis. If it accumulates on your teeth, it can inflame your gums and cause a gap to form between the teeth and the gums. Once this “pocket” opens up, the inflammation will continue and potentially lead to bone loss, then loose or missing teeth.

FIGHT BACK AGAINST A PLAQUE ATTACK BY INCLUDING THESE SIMPLE STEPS IN YOUR LIFESTYLE:

1. **Floss every day.** Flossing removes plaque from between your teeth and under your gum line, where your toothbrush can’t reach. Floss before you brush your teeth, preferably before you go to bed at night.
2. **Brush your teeth after eating.** At the very least, brush after breakfast and never forget to brush before you go to bed.
3. **Maintain a healthy lifestyle.** That means a nutritious diet, and abstaining from tobacco, the use of which has been linked to the development of gum disease and deterioration of overall health.
4. **Visit your dentist regularly** – that’s as frequently as every three months in some cases – for professional cleanings, where the dentist or hygienist will remove any plaque or tartar.

Call for a dental appointment immediately if you notice any possible symptoms of gum disease. The good news is that with proper care, gum disease can often be prevented. Even if it has started, it can usually be treated and halted if you catch it in the early stages.

OUT OF MOUTH, OUT OF MIND

Your teeth, when all present, keep each other in line. When one is knocked out or lost due to dental decay, there can be some unfortunate consequences, including movement of the remaining teeth, (the resulting gap opens up a space for surrounding teeth to drift out of position, shift, or tip into the empty space and change your bite), pains in your jaw, cavities, gum disease and the potential to lose more teeth.

The posterior teeth have an obvious, important role in chewing. As teeth are lost, you'll be forced to chew in other areas, which sometimes leads to excessive wear or erosion of remaining teeth, tooth fractures from overloading, and painful problems with the temporomandibular joints that unite the lower jaw with the skull.

In addition, as soon as a tooth is lost, the surrounding bone starts to deteriorate. How quickly this happens will depend on the bone's density, your bite and how well your teeth align with each other. In some cases the loss of a back tooth can eventually cause a deterioration in facial appearance due to lower facial height.

Please talk to us about replacements for any missing teeth. Early intervention is paramount. A replacement tooth will keep your other teeth in line and help you avoid the possibility of orthodontic and other dental treatments down the road.

Missing a back tooth? Most people don't consider it as important as missing a front tooth. You should be aware, however, that even if a gap in the back isn't visible in your up-front smile, there are very good reasons why you still need to replace any missing back teeth, the sooner, the better.

ORAL CANCER: THE IMPORTANCE OF EARLY DIAGNOSIS

According to the Center for Disease Control and Prevention, mouth and throat cancers are the sixth most common cancers identified in U.S. males, and the fourth most common in African American men. Thirty-thousand people in the U.S. are diagnosed with mouth and throat cancer each year, and 8,000 die of these cancers. That's almost one per hour, every day of the year. Similarly, the Canadian Cancer Society estimates that 3,200 new cases of oral cancer were diagnosed in Canada in 2007, with an estimated 1,100 patients succumbing to the disease.

Even more tragic about these death rates is that oral cancer has an 80 to 90 percent chance of being cured if it is diagnosed and treated immediately. The key is to recognize the symptoms early.

You may think of your regular dental checkup only as a chance to check for dental decay, and an opportunity to clean and shine your teeth a couple of times a year. What you may not be aware of is that while we're checking your gums and teeth, we're also looking all around your mouth for early signs of oral cancer, which in most cases doesn't hurt and therefore may not be noticed by a patient.

Here are some indicators you can watch out for:

- Any irritation or swelling on the lip or in the mouth.
- A lump in the neck that lasts longer than two weeks.
- Velvety red or white patches in the mouth.
- Ulcers or sores in the mouth that do not heal.
- A lump in the lip, mouth, gums, tongue or neck, or a thickening in the cheek.
- Bleeding in the mouth.
- Pain in the mouth that won't go away.
- Loose teeth, or dentures that no longer fit.

While these symptoms do not automatically mean you have cancer or a pre-cancerous condition, they do necessitate an immediate appointment with your doctor or dentist.

Please call us if you have any questions about oral cancer, and about its signs, symptoms and treatment.

WISE ADVICE ON WISDOM TEETH

Still have your wisdom teeth? Even if they're not bothering you, it may not be the wisest decision to keep them.

Many times a dentist will recommend removing wisdom teeth, despite the fact you're not feeling any discomfort at all. While this may seem suspicious, there are sound reasons a dentist may suggest this.

Wisdom teeth, also called third molars, typically erupt once all other teeth are in place and there is no more room in your mouth to accommodate four more back teeth. If they can't erupt fully, these extra teeth grow under the gums, leaning into the roots of the existing teeth. The wisdom teeth then become stuck, or impacted, and not only cannot erupt into a proper position in the mouth, but can also damage the roots of the already-erupted permanent teeth. Having these extra teeth trapped under your gums can result in infection, the formation of cysts, and gum disease.

Despite all this action under the gums, most people usually do not realize their wisdom teeth are impacted until their dentist discovers so on an x-ray. At this point, the dentist may recommend extracting the teeth before they become more difficult to remove and start causing serious dental issues. Ideally, this is when the patient is in his late teens or early twenties, as extractions tend to become more difficult as the patient grows older.

If you still have your wisdom teeth, please ask us about their health and positioning. It's wise to be informed of any possible problems sooner rather than later.

THE LAST WORD ON: DENTAL INSURANCE BENEFITS

Have you hit your maximum yearly allowance for your dental insurance benefits? Dental benefits are usually calculated over a calendar or fiscal year, meaning that if you don't use your benefits before your year-end, you'll lose them.

It's a good idea to have a look at your dental insurance summary occasionally, to refresh your memory of the benefits covered under your plan. We are acquainted with a number of different insurance plans at our office, so chances are good that we're familiar with yours.

If you have insurance benefits that are going to help you maintain and improve your dental health, why not take advantage of them? Dental problems don't tend to improve on their own, and since we know that dental health is linked to overall well-being, it makes sense to ensure that your teeth, gums and mouth are professionally checked on a regular basis, especially if you already have dental insurance benefits in place to help cover the cost.

Main Street Dental Team

Dr. Shirley Ho
Dr. Harvey Schwartz

Dr. Harvey E. Schwartz & Dr. Shirley Ho

104 Main Street
Unionville, ON L3R 2E9

Phone: (905) 477-1655
Toll-Free: (877) 357-2440

Office Hours:
Mon., Tues., Wed., Fri.: 8 a.m. - 6 p.m.
Thurs.: 8 a.m. - 7 p.m.
Sat.: 8:30 a.m. - 4 p.m.

Our Services Include:

- General Dentistry
- Emergency Dental Care
- Tooth Whitening
- Cosmetic Dentistry
- Denture Fittings & Dental Implants
- Bonding, Veneers, Crowns, Bridges
